

Canopy cover and estimated surface cooling

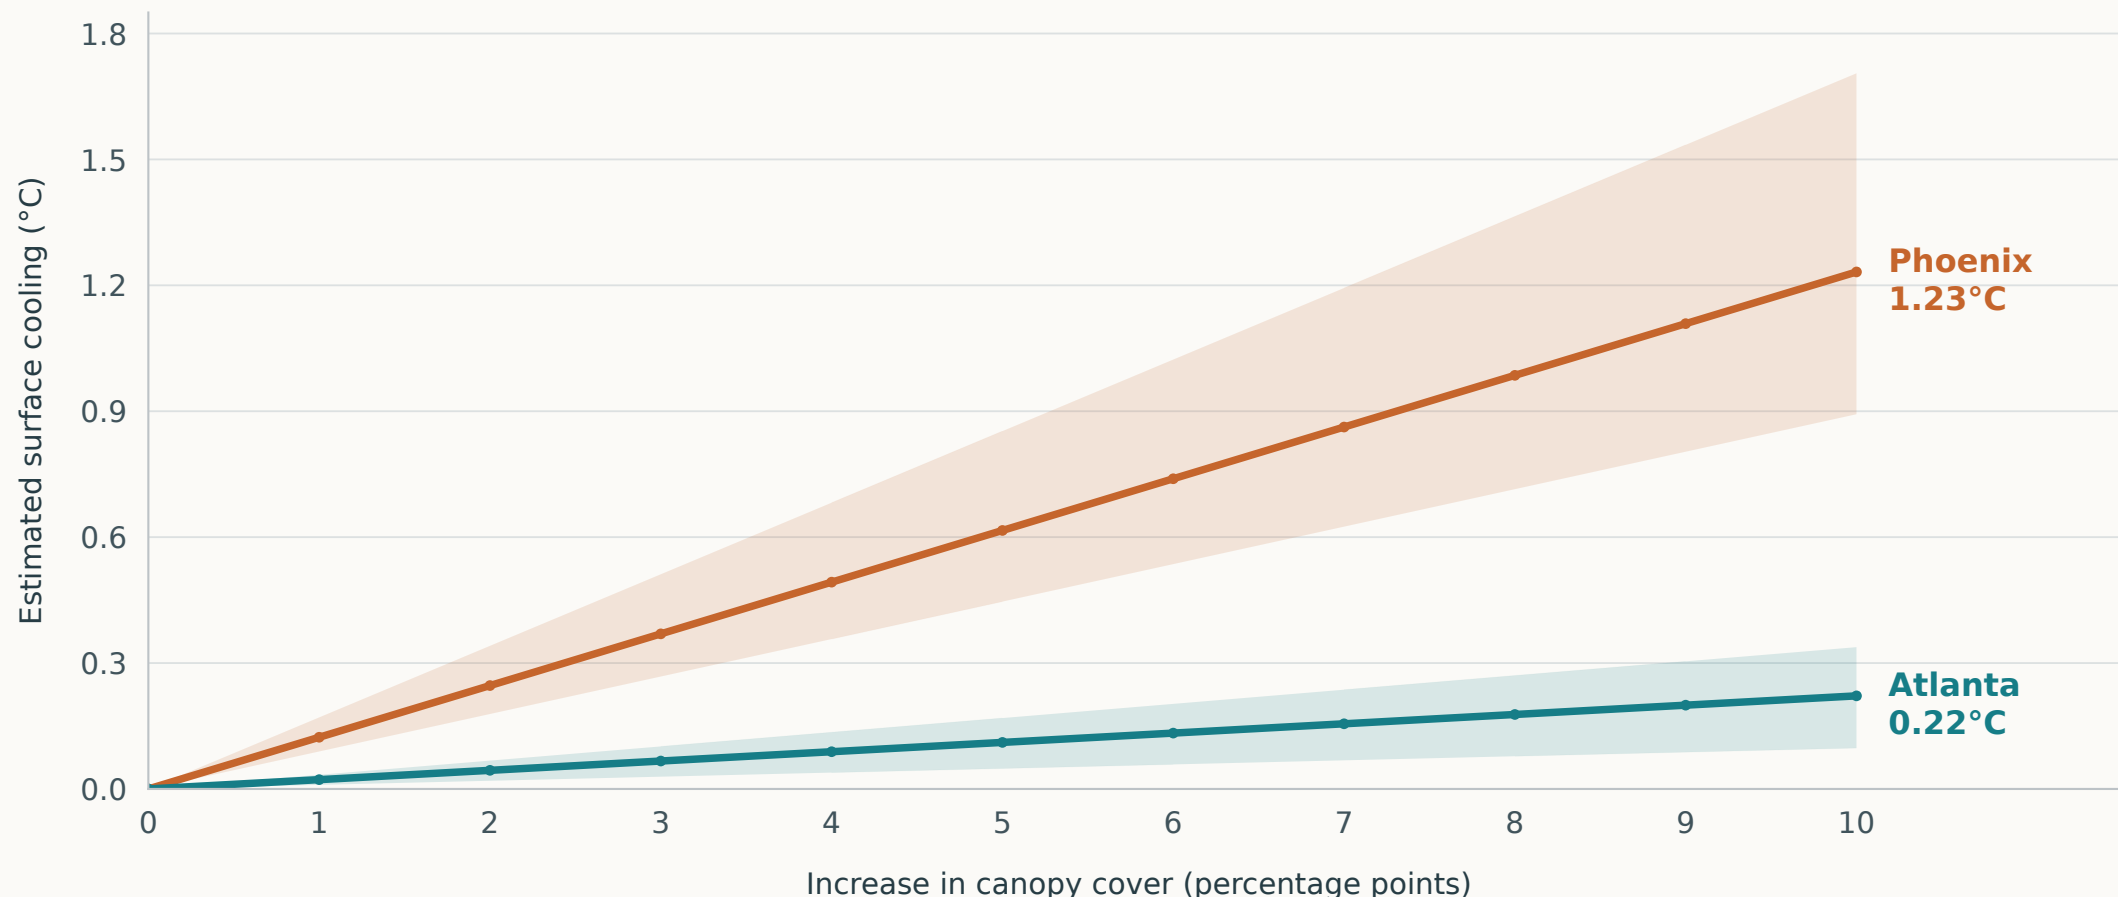

2023 pilot | 11 Phoenix passes + 5 Atlanta passes | LST model

PHOENIX • 11 PASSES

0.123°C per +1 percentage point

ATLANTA • 5 PASSES

0.022°C per +1 percentage point

Solid lines: median pass slope. Shading: minimum-maximum across passes, not confidence intervals.

+1 percentage point means, for example, 10% → 11% canopy cover. Positive values mean cooler surfaces.

Straight lines reflect the current linear model. The x-axis shows a change in cover, not total canopy cover.

Exploratory associations; dates and conditions differ. These are not forecasts of the effect of planting trees.
