

Canopy cooling, allowing the association to curve

Existing 2023 observations · Original neighborhood and land-cover controls · Exploratory check

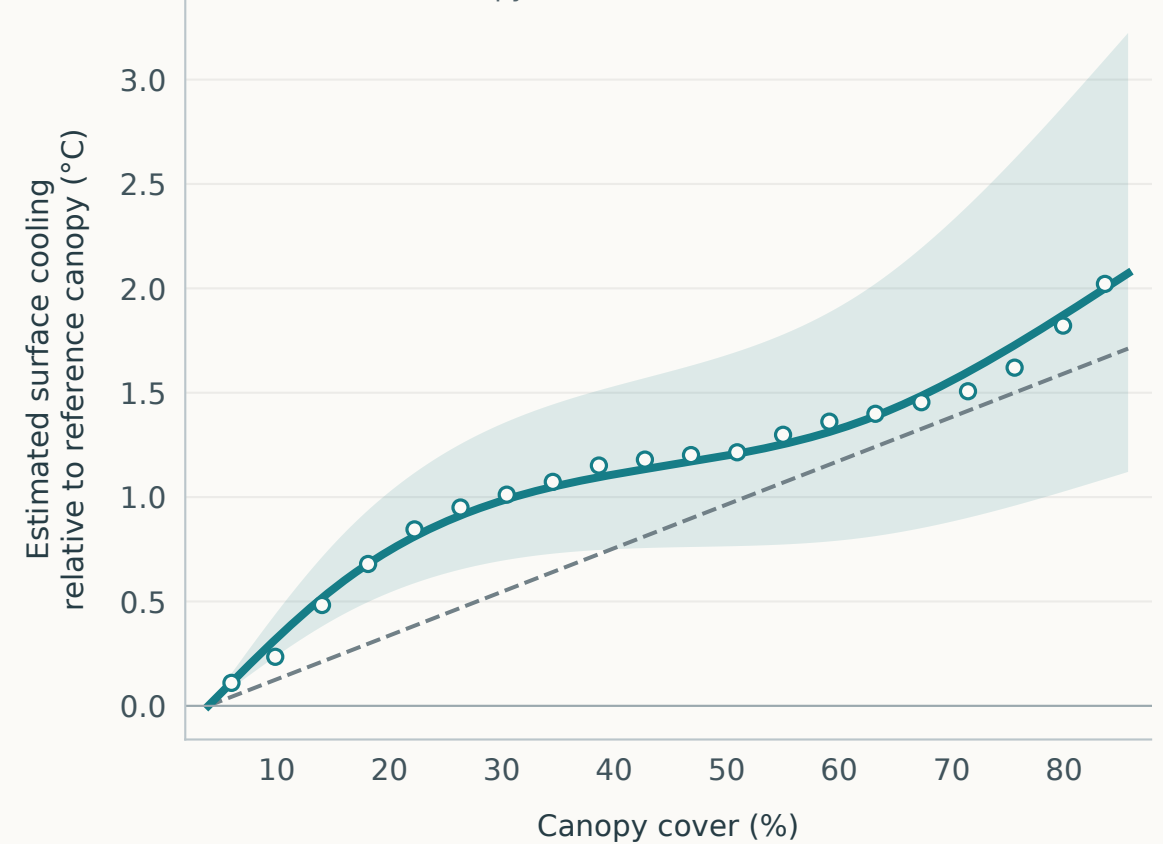

Phoenix · 11 passes

Reference: 0.31% canopy

Atlanta · 5 passes

Reference: 3.89% canopy

- Flexible fit: mean across passes
- Adjusted observations in bins
- Earlier linear fit
- Range across passes

Positive = cooler. Each city's curve starts at its own reference; canopy ranges differ substantially.

Shading shows pass-to-pass variation, not confidence intervals. Dots have block/context adjustment.

The flexible curve is still an estimate. Dates, weather and spatial confounding limit causal interpretation.
